RR1060 A critical review of evidence related to hand-arm vibration syndrome and the extent of exposure to vibration. This report describes a systematic literature review on the nature of the exposure-response relationship between hand-transmitted vibration and the elements of hand-arm vibration syndrome (HAVS), ie the vascular, neurosensory and musculoskeletal components.

Whole body vibration (WBV) is a generic term used when vibrations (mechanical oscillations) of any frequency are transferred to the human body. Humans are exposed to vibration through a contact surface that is in a mechanical vibrating state. Human's are generally exposed to many different forms of vibration in their daily lives.

Some understanding of ground vibration standards, how they were developed, what they say, how they are properly used and what their shortcomings and limitations might be, especially in construction contexts, is vital to evaluating the reliability of statements based on standards.
