Facts About Tardigrades - Live Science

Tardigrades are also known as moss piglets or water bears are a small phylum of around 1,000 miniature species found in some of the planet's most inhospitable places, from the highest mountains to the deepest seas. Also known as moss piglets or water bears, they move using four pairs of stumpy legs, which end in hooks or sucking discs.

Facts About Tardigrades or Water Bears | Sport Diver

Although tardigrades generally consist of males and females, some species have been identified as parthenogenic (a form of asexual reproduction) or even hermaphroditic. The tardigrade's survival and adaptability strategies are so effective it shouldn't be surprising that its mating method is just as efficient. In most observed species, when the female molts, she leaves some eggs in her cast-off skin, after which the male fertilizes them with sperm and then lumbers on his way.

The Siberian tardigrade fossils differ from living tardigrades in several ways. They have three pairs of legs rather than four, they have a simplified head morphology, and they have no posterior head appendages, but they share with modern tardigrades their columnar cuticle construction.

Tardigrade - Wikipedia

Tardigrades are a.k.a. moss piglets or water bears are the scientific gift that just keeps on giving. Everything about these microscopic animals is extreme. They've been on Earth since long before the dinosaurs. They can withstand blistering cold, intense heat, years without food or water, and hanging out in the vacuum of space. They're practically unkillable. So it makes sense that their sex lives would also be interesting.
